Introduction

The focus of the current document is to analyse and calculate the time complexity of the simulator developed in USEI02 and its subsequent User Stories, as well as their auxiliary methods.

In this analysis, we are considering that all Java natively implemented classes and methods run according to their theoretical time complexity.

Simulator Complexity

Method getMinTime()

Code	Complexity
public static int getMinTime() {	O(1)
int minTime = Integer. MAX_VALUE;	O(1)
for (Machine machine : <i>machineTimeRemaining</i> .keySet()) {	O(m)
if (<i>machineTimeRemaining</i> .get(machine) < minTime) {	O(1)
minTime = machineTimeRemaining.get(machine);}}	O(1)
return minTime;}	O(1)

Table 1 – getMinTime method.

The time complexity of this method is O(m) where m is the number of machines.

Method calcTime()

Code	Complexity
private static int calcTime(Queue <item> items, Item item, int time) {</item>	O(1)
int queueTime = 0;	O(1)
for (Item i: items) {	O(i)
if (pFlag) {	O(1)
if (!checkPriority(i, item)) {	O(1)
queueTime += time; }	O(1)
} else queueTime += time; }	O(1)
return queueTime;}	O(1)

Table 2 - calcTime method.

The time complexity of this method is O(i) where i is the number of items. The method checkPriority() called inside this method is a simple compareTo method with O(1) time complexity.

Method verifyFastestMachine()

Line number	Complexity
1	O(1)
2	O(m)
3	O(1)
4	O(1)
5	O(1)
6	O(1)
7	O(1)
8	O(i)
9	O(i)
10	O(1)
11	O(1)
12	O(i)
13	O(1)
14	O(1)
15	O(i)
16	O(1)
17	O(1)
18	O(1)

Table 3 - verifyFastestMachine method.

The time complexity of this method is O(m * 2i) or simply O(m * i), where is the number of machines and i is the number of items.

Method organizeQueue()

Line number	Complexity
1	O(1)
2	O(1)
3	O(1)
4	O(m)
5	O(1)
6	0(1)
7	0(1)
8	0(1)
9	O (i)
10	O (i)
11	0(1)
12	0(1)
13	O(1)
14	O (i)
15	0(1)
16	O(1)
17	0(1)
18	0(1)
19	0(1)
20	O(1)
21	0(1)
22	O(i)
23	O(1)

Table 4 – organizeQueue method.

The time complexity of this method is $O(m * i^3)$, where m is the number of machines and i is the number of items.

Method addItemToQueue()

```
if (machineItemQueue.containsKey(machine)) {
9 ConsoleWriter.displayLog("ITEM " + item.getId() + ANSICol-
ors.paint(" ASSIGNED ", ANSIColors.ANSI_LIGHT_GREEN) + "TO MACHINE " + machine.getId());
                                   machine.setTimeActive(new Time(simulationTime), new Time(0));
ConsoleWriter.displayLog("ITEM " + item.getId() + ANSICol-
 Line number
                                                                                                         Complexity
                                                                                                                   O(1)

                                                                                                                   O(1)
 11
 12
                                                                                                                   0(1)
 13
                                                                                                                   0(1)
                                                                                                                   O(1)
 14
 15
                                                                                                                   O(1)
 16
                                                                                                                   O(1)
 17
                                                                                                                   O(1)
 18
                                                                                                                   0(1)
 19
                                                                                                                   O(1)
```

Table 5 – addItemToQueue method.

This method has a time complexity of $O(m^4 * i^5)$, where m is the number of machines and i is the number of items.

Method simulateProduction()

```
static void simulateProduction() {
     int minTime;
                         machineTimeRemaining.replace(m, new Time(0));
           Map<Machine, Time> machineTimeCopy = new LinkedHashMap<>(machineTimeRemain-
                    if (machineItemQueue.containsKey(machine) && !machineItemQueue.get(ma-
                         Item item = itemQueue.poll();
if (item != null) {
                              item.setProductionTime(item.getProdTime() + machine.getOpera-
tionTime().toSeconds());
ConsoleWriter.displayLog("ITEM " + item.getId() + ANSICol-
ors.paint(" MOVED ", ANSIColors.ANSI_LIGHT_YELLOW) + item.getOperations().get(item.get-
                                  addItemToQueue(Collections.singletonList(item));
                              if (machineItemQueue.get(machine).isEmpty()) {
```

42	O(1)
43	O(m)
44	O(1)
45	O(m)
46	O(1)
47	O(1)

Table 6 - simulateProduction method.

The final calculated time complexity of the simulator is $O(m^6 * i^5)$.

USEI03 Complexity

Code	Complexity
<pre>public static void printTotalProdTime() {</pre>	O(1)
System.out.print("TOTAL PRODUCTION TIME: " + new	O(1)
Time(simulationTime) + "s ("+new Time(simulationTime).to-	
Seconds()+"s).\forall n");}	

Table 7 – USEI03 method.

The USEI03's method was implemented with a simple print function, so it's time complexity is O(1).

USEI04 Complexity

Code	Complexity
public static void displayExecutionTimesByOperation() {	O(1)
for (String operation : operationTimes.keySet()) {	O(op)
System.out.println(operation + " total execution time: " +	O(1)
operationTimes.get(operation) + "s");}}	

Table 8 - USEI04 method.

The USEI04's method time complexity is $O(\mathsf{op})$, where m is the number of operations.

USEI05 Complexity

```
public static void printMachineOperatingPerc() {
   int allProductions = 0;
   for (Item item : items) {
      allProductions += item.getProdTime();}
   machines.sort(Comparator.comparing(Machine::getTimeActiveInInt));
   for (Machine machine : machines) {
      float timeInPerc = (float) (machine.getTimeActiveInInt() * 100) / allProductions;
      float timeOperationInPerc = (float) (machine.getTimeActiveInInt() * 100) / operationTimes.get(machine.getOperationName()).toSeconds();
      System.out.printf("Machine %s| OPERATING TIME: %ss - %.2f%% of total production time - %.2f%% of total %s time.\n", machine.getId(), new Time(machine.getTimeActiveInInt()), timeInPerc, timeOperationInPerc, machine.getOperationName());}
   System.out.println("\n===========\n");}
```

Code	Complexity
1	O(1)
2	O(1)
3	O(i)
4	O(1)
5	O(1)
6	O(m)
7	O(1)
8	O(1)
9	O(1)
10	O(1)

Table 9 - USEI05 method.

The USEI05's method time complexity is O(m + i), where m is the number of machines and i is the number of items.

USEI06 Complexity

Code	Complexity
1	O(1)
2	0(1)
3	O(m)
4	O(1)
5	0(1)
6	0(1)
7	O(op)
8	0(1)

10	O(1)
11	0(1)
12	O(m)
13	O(1)
14	O(1)
15	O(1)
16	O(t)
17	O(1)
18	O(t)

19	O(1)
20	O(1)
21	O(1)
22	O(1)
23	O(1)
24	O(1)
25	O(1)
26	O(1)
27	O(1)
28	O(av)
29	O(1)
30	0(1)

Table 9 – USEI06 method.

The USEI06's method time complexity is O(op * m * t), where op is the number of operations, m is the number of machines, and t is the number of relevant time events.

USEI07 Complexity

Code	Complexity
1	O(1)
2	O(1)
3	O(i)
4	O(1)
5	O(m)
6	O(1)
7	O(1)
